[A] Short-Circuit Protection (Lower-arms only with the external shunt resistor and CR filter)

- a1. Normal operation : IGBT ON and carrying current.
- a2. Short circuit current detection (SC trigger).
- a3. IGBT gate hard interruption.
- a4. IGBT turns OFF.
- a5. Fo output with a fixed pulse width determined by the external capacitor CFO.
- a6. Input = "L" : IGBT OFF
- a7. Input = "H" :

a8. IGBT OFF state in spite of input "H".

[B] Under-Voltage Protection (Lower-arm, UVD)

b1. Control supply voltage rising : After the voltage level reaches UVDr, the circuits start to operate when next input is applied.

b2. Normal operation : IGBT ON and carrying current.

- b3. Under voltage trip (UVDt).
- b4. IGBT OFF in spite of control input condition.
- b5. Fo keeps output during the UV period, however, Fo pulse is not less than the fixed width for very short UV interval.
- b6. Under voltage reset (UVDr).
- b7. Normal operation : IGBT ON and carrying current.

[C] Under-Voltage Protection (Upper-side, UVDB)

- c1. Control supply voltage rises : After the voltage reaches UVDBr, the circuits start to operate when next input is applied. c2. Normal operation : IGBT ON and carrying current.
- c3. Under voltage trip (UVDBt).
- c4. IGBT OFF in spite of control input signal level, but there is no Fo signal output.
- c5. Under voltage reset (UVDBr)
- c6. Normal operation : IGBT ON and carrying current.

Fig. 6 MCU I/O INTERFACE CIRCUIT

Note : RC coupling at each input (parts shown dotted) may change depending on the PWM control scheme used in the application and the wiring impedance of the application's printed circuit board. The DIP-IPM input signal section integrates a 2.5k Ω (min) pull-down resistor. Therefore, when using a external filtering resistor, pay attention to the turn-on threshold voltage requirement.

TRANSFER-MOLD TYPE INSULATED TYPE

Fig. 8 AN EXAMPLE OF TYPICAL DIP-IPM APPLICATION CIRCUT WITH 1 SHUNT RESISTOR C1:Tight tolerance temp-compensated electrolytic type

Note 1: To avoid malfunction, the wiring of each input should be as short as possible. (less than 2-3cm)
2: By virtue of integrating HVIC inside the module, direct coupling to MCU terminals without any opto-coupler or transformer isolation is possible.
3: Fo output is open drain type. The signal line should be pulled up to the positive side of a 5V supply with an approximate 10kΩ resistor.

- 4: Fo output pulse width (tFO) should be determined by connecting external capacitor C4 between CFO and VNC terminals. (Example :

- 4: Fo output pulse wight (tro) should be determined by connecting control supervise or entrol supervise or entrol supervise of the protection of the protection function, the wiring of A, B, C should be as short as possible.
 5: The time constant R5C1 of the protection circuit should be selected in the range of 1.5~2µs. SC interrupting time might vary with the wiring control of the protection circuit should be selected in the range of 1.5~2µs. SC interrupting time might vary with the wiring control of the protection circuit should be selected in the range of 1.5~2µs. wiring pattern.
- 8: All capacitors should be mounted as close to the terminals of the DIP-IPM as possible.
 9: To prevent surge destruction, the wiring between the smoothing capacitor and the P&N1 terminals should be as short as possible. Generally a 0.1~0.22µF snubber between the P&N1 terminals is recommended.
- 10: It is recommended to insert a Zener diode (24V/1W) between each pair of control supply terminals to prevent surge destruction.
- 11: To prevent LVIC from surge destruction, it is recommended to mount a fast recovery type diode between VNC and NU, NV, NW terminals.
